

# DOLLAR SPOT FUNGUS (Late Spring/Early Summer)

## YOUR LAWN HAS DOLLAR SPOT FUNGUS

Dollar spot fungus is caused by too much surface moisture in the 75° to 85° degree temperature range. This is caused by constant damp conditions either from frequent rain, misty weather, incorrect watering habits such as shallow frequent watering (15 - 20 mins. per zone) or by poor draining soils. Occasionally a supplemental feeding of fertilizer may help alleviate this condition and in severe cases a fungicide may need to be applied. The fungicides will only help if the causes are corrected (weather and irrigation). If you have any questions or want the fungicide application please call and we will be glad to advise you accordingly.
